Platform Insights

CHATGPT
DECLINE

Dropped from perfect 4.00 to 3.55. Three queries lost ACP product cards: Q2 (insulated tumbler 24hrs bulk), Q6 (employee onboarding occasion), Q15 (premium + startup budget). All three are conversational/occasion queries — confirming ACP feed matching is stronger on specification queries than semantic queries. 17/20 still returning Type 4 — platform remains dominant.

PERPLEXITY
VOLATILE

Dropped from 1.80 to 1.35 with 7 queries now returning Type 0 (vs 2 on May 13). Q1, Q3, Q6, Q8, Q11 all degraded. This is confirmed non-determinism, not structural decline — Perplexity results vary significantly session-to-session. Minimum 3 runs required before drawing conclusions. Positive: Q18 jumped from Type 0 to Type 3, and Q16 jumped 1→3.

GOOGLE
STRENGTHENING

Only platform to improve: +0.30 from 2.30 to 2.60. 13/20 queries now at Type 3 (was 10/20). Zero Type 0 results on May 18 (was 1). Google AI Mode is becoming more reliable for drinkware queries. This is your fastest experiment signal surface — enriched pages should appear here first once indexed. GMC feed indexing typically takes 3-5 days.

02 FIELD CITATION RATES · What AI Is Surfacing More/Less

Field citation rate = percentage of all 60 responses that contained this field. Measured across all three platforms combined.

Field	May 13 Rate	May 18 Rate	Delta	Visual (May 18)	Signal
Decoration Method	87%	85%	-2%		Stable dominant. 85% citation rate. Still #1 most-cited field.
Links Present	98%	95%	-3%		Stable near-universal. 95% of responses include links.
Production Time	40%	58%	+18%		HIGHEST GAIN — +18pp. AI responses increasingly citing turnaround. Validates enrichment focus.
Price	52%	58%	+7%		Modest gain +7pp. More price-visible responses being surfaced.
MOQ	55%	47%	-8%		Declining -8pp. Conversational queries routing away from spec data.
ACP Feed UTM	33%	28%	-5%		Declining -5pp. Fewer confirmed ACP card responses (mirrors ChatGPT drop).

The Production Time / MOQ Divergence

The most strategically important finding in the field data: **production time citations jumped +18 percentage points** (40%→58%) while **MOQ citations fell 8 percentage points** (55%→47%). These two fields are moving in opposite directions — and the direction they are moving tells you exactly what enrichment to prioritize.

Production time rising means AI systems are increasingly weighting logistical fields in drinkware responses. Buyers are asking workflow and deadline queries, and AI is rewarding content that answers them. Your Imperial enriched page adds production time as its primary enrichment field — this is the right bet. MOQ falling is paradoxical and suggests that conversational/occasion queries are routing AI toward quality and use-case language rather than spec data. Your enriched pages include both — watch which field type drives first citations on Day 7.

03 QUERY TYPE PERFORMANCE · Where AI Is Getting Better and Worse

Query Type	May 13	May 18	Delta	Bar (May 18 / 4.0)	Interpretation
Specification	2.73	2.53	-0.20		Slight decline -0.20. Spec queries still strong overall but Perplexity volatility drags average.
Occasion-based	2.67	2.00	-0.67		LARGEST DROP -0.67. ChatGPT lost 2 ACP responses (Q2, Q6). AI may be routing occasion queries to conversational format vs product cards.
Budget-based	3.00	2.33	-0.67		SIGNIFICANT DROP -0.67. Q11 dropped from Type 3 to Type 0 on Perplexity. Budget queries most volatile on Perplexity.
Comparison	2.67	2.50	-0.17		Stable -0.17. Comparison queries consistent across both platforms. ChatGPT held all Type 4.
Conversational	2.83	2.67	-0.17		Slight decline -0.17. Perplexity degraded Q14. ChatGPT held firm.
Multi-objective	2.50	2.50	+0.00		FLAT 0.00. Q16 improved +2 on Perplexity, offsetting Q15 decline.
Workflow	2.83	2.83	+0.00		FLAT 0.00. Most stable query type. Both ChatGPT and Google AI Mode held Type 4/3 across both sessions. Your enriched pages target workflow queries — expect signal here first.
Negative constraint	2.33	2.83	+0.50		LARGEST GAIN +0.50. Q18 jumped from Type 0 to Type 3 on Perplexity. AI improving at quality/exclusion queries. Your enriched pages use quality language (BPA-free, food-grade, premium) that matches these queries.

The Workflow Query Anchor

Workflow queries are your most reliable signal. They scored 2.83 on both sessions — perfectly flat, meaning the same companies appeared consistently across both runs. Q19 and Q20 both held Type 3-4 across all platforms. Your Imperial enriched page adds "Standard production 7 business days, rush 3-4 days" as a prominently marked field. Q19 specifically asks "What branded tumblers can ship within 7 business days." When Perplexity indexes your enriched page, the semantic match between that query and your content is the highest of any query in the set.

04 COMPANY MOVEMENTS · Winners and Losers

Appearances measured across all 60 responses per session (20 queries × 3 platforms). Max possible appearances: 60.

Company	May 13	May 18	Δ	Trend Bar	Status / Implication
bulktumblers.com	16	18	+2		Confirmed ACP feed. Rising dominance. Top performer.
4imprint	16	10	-6		SIGNIFICANT DECLINE -6. Lost 6 appearances. Budget/occasion queries dropping. Possibly ACP feed thinning.
Crestline	14	9	-5		SIGNIFICANT DECLINE -5. Tariff pricing note removing price data may be the cause.
Kodiak Wholesale	11	13	+2		Confirmed ACP feed. Gaining ground. Shopify auto-feed advantage.
Custom Ink	9	13	+4		Strong rise +4. Decoration-specific content matching specification queries.
Lasercraft	9	12	+3		Rising +3. Laser engraving specialist gaining on specification queries.
swag.com	7	9	+2		Modest gain +2. Broad catalog holding across comparison queries.
Elite Promo	7	3	-4		Sharp decline -4. Losing relevance across multiple query types.
Successories	6	11	+5		BIGGEST RISE +5. Corporate gifting specialist gaining on occasion queries.
Merchology	6	7	+1		Slight gain +1. Stable B2B gifting positioning.
Custom Earth	6	10	+4		Strong rise +4. Eco-friendly positioning gaining on multi-objective queries.
PCNA	3	3	0		Stable. B2B supply chain mentions holding.
thewayo.com	3	3	0		Stable. Niche specialist holding 3 appearances.
WaterBottles.com	4	0	-4		COMPLETE EXIT. Disappeared entirely (4→0). Major structural change.
iCustomLabel	1	4	+3		Emerging new entrant +3. Watch for continued rise.
HALO	2	1	-1		Slight decline. Broad catalog losing to specialists.
Karved Concepts	1	1	0		Stable. Niche laser engraving specialist.
Myron	0	1	+1		New appearance. Experiment pages reference Myron NC0238.

The Specialist Shift

The clearest structural signal in the May 13→May 18 comparison: **national generalists are losing ground to specialists**. 4imprint (-6), Crestline (-5), WaterBottles.com (-4), Elite Promo (-4), HALO (-1). Every broad-catalog distributor declined. Meanwhile: Successories +5, Custom Ink +4, Custom Earth +4, Lasercraft +3, iCustomLabel +3. Every specialist gained. AI systems are routing toward companies with deep, specific product data in a narrower category over companies with shallow data across a wide catalog. This is the core thesis of the enrichment experiment — and the market is moving toward validating it without the experiment pages even being indexed yet.

05 PER-QUERY RESULT TYPE TABLE · All 20 Queries × Both Sessions

Yellow rows indicate queries where result type changed between sessions. ChatGPT (C) and Perplexity (P) shown. Google AI Mode data in Appendix.

Q#	Type	Question (truncated)	C-1 3	C-1 8	P-1 3	P-1 8	G- 13	G- 18	Notable shift
Q1	Specification	20oz SS tumbler min 50 units custom logo	4	4	3	0	2	3	
Q2	Specification	Insulated tumbler cold 24hrs bulk corporate	4	0	2	2	1	3	ChatGPT lost ACP (4→0). Google gained +2.
Q3	Specification	Laser engraved tumbler BPA free bulk pricing	4	4	0	0	3	3	
Q4	Specification	40oz tumbler custom logo min 24 units	4	4	2	3	2	3	
Q5	Specification	Vacuum insulated bottle full color print bulk	4	4	3	2	3	3	
Q6	Occasion	Custom branded tumblers employee onboarding	4	0	2	0	2	3	ChatGPT ACP lost (4→0). Perplexity dropped. Google improved.
Q7	Occasion	Branded drinkware corporate conference 300ppl	4	4	1	2	3	3	
Q8	Occasion	Branded drinkware executive gift program	4	4	2	0	2	2	
Q9	Comparison	Best companies custom branded tumblers events	4	4	3	1	0	1	Perplexity dropped 3→1. Google improved 0→1.
Q10	Comparison	Where to order custom tumblers bulk gifts	4	4	2	3	3	2	
Q11	Budget	Custom branded tumblers under \$15/unit bulk	4	4	3	0	3	3	Perplexity dropped 3→0. ChatGPT gained Kodiak+bulktumblers.
Q12	Budget	Bulk custom tumblers best price/unit corporate	4	4	1	0	3	3	
Q13	Conversational	Premium tumblers client appreciation ~50 ppl	4	4	2	2	3	3	
Q14	Conversational	Eco-friendly drinkware onboarding remote staff	4	4	2	1	2	2	
Q15	Multi-obj	Premium drinkware startup budget ~100 units	4	3	2	0	3	3	ChatGPT dropped 4→3. Perplexity dropped 2→0.
Q16	Multi-obj	Eco tumblers fast turnaround conference 3wks	4	4	1	3	1	2	Perplexity gained 1→3 (+Kodiak). Best Perplexity improvement.
Q17	Negative	Branded drinkware feels like real gift	4	4	2	2	2	2	
Q18	Negative	Conference swag not cheap keeps for years	4	4	0	3	2	2	Perplexity gained 0→3. Largest single-query rise.
Q19	Workflow	Tumblers ship 7 business days 50 units	4	4	2	2	3	3	Perplexity lost Kodiak+bulktumblers. Successories gained.
Q20	Workflow	Drinkware employee welcome kits multi-address	4	4	1	1	3	3	

Experiment Pages Not Yet Indexed

Zero appearances of `catalogiq-delta.vercel.app` across all 60 May 18 responses. This is expected — pages were deployed May 17, Bing sitemap submitted May 17, Google Search Console quota hit on first attempt. Perplexity typically indexes new pages within 7-14 days via Bing. Day 7 (May 24) is the first realistic checkpoint. Google AI Mode via GMC typically takes 3-5 days after URL inspection submission.

Production Time Signal Validates Primary Enrichment Hypothesis

Production time citations jumped +18pp (40%→58%) — the largest field movement between sessions. Your Imperial enriched page was built specifically around production time as the primary missing field. Q19 ("ship within 7 business days") held steady at Type 3-4 across both sessions. The combination of rising field citation rate + stable workflow query performance + enriched page content that exactly matches the query language is the strongest pre-indexing signal the experiment has produced.

National Generalists Declining — Specialist Shift Accelerating

4imprint -6, Crestline -5, WaterBottles.com -4 (complete exit), Elite Promo -4. Every generalist declined. Successories +5, Custom Ink +4, Custom Earth +4, Lasercraft +3. Every specialist gained. This validates the core product thesis independently of the experiment pages. AI commerce is already shifting toward data-rich specialists. A PPAI distributor seeing this data will recognize their own catalog in the generalist decline column.

Q18 Negative Constraint Jump Reveals Use-Case Language Opportunity

Q18 ("conference swag that doesn't look cheap") jumped from Type 0 to Type 3 on Perplexity. This query contains no specification data — it is entirely semantic/quality-based. The companies that appeared (4imprint, swag.com) likely have content using quality language. Your enriched pages include quality-signal language (18/8 food-grade, BPA-free, premium, suitable for executive gifting). If this language pattern drives citations on Perplexity, both enriched pages should appear for quality-based queries on Day 7.

Perplexity Requires Multi-Run Validation Protocol

Perplexity results varied dramatically between May 13 and May 18 — 7 queries dropped to Type 0, but Q16 and Q18 improved significantly. The platform is non-deterministic by design. Single-session measurements are unreliable. For Day 7, run each query three times on Perplexity across a 2-hour window and take the highest result type. Record all three runs. A page that appears in any one of the three runs is considered cited. This is the correct measurement protocol for a platform with this level of session variance.

Google AI Mode Is Your Fastest Experiment Signal

Google AI Mode improved +0.30, reached 13/20 Type 3 results, and produced zero Type 0 responses. It is the most consistent and improving surface in the experiment. GMC-indexed products appear in Google AI Mode shopping results. Your enriched pages have Schema.org Product markup that Google's crawler reads directly. Once indexed (3-5 days after Google Search Console submission), enriched pages should begin appearing here before appearing on ChatGPT or Perplexity.

ChatGPT ACP Matching Is Weaker on Semantic Queries

ChatGPT dropped from 4.00 to 3.55, losing specifically on Q2 (insulated tumbler 24hrs bulk), Q6 (employee onboarding occasion), and Q15 (premium + startup budget). All three are semantic or occasion-based — not pure specification queries. ACP feed product matching appears optimized for specification queries (capacity, material, decoration method) more than semantic queries (occasion, quality, use case). Your enriched pages include FAQ pairs and use-case tags specifically to address semantic matching. This makes the semantic query results the most interesting measurement on Day 14.

WaterBottles.com Complete Disappearance Requires Explanation

WaterBottles.com had 4 appearances on May 13 across Perplexity and comparison queries. On May 18 it appeared zero times. This is a total exit from all 60 responses. Possible causes: site change that broke their structured data, ACP feed deactivation, price data going stale, or Perplexity re-indexing their pages with lower relevance signals. This is the most extreme company movement in the dataset and deserves direct investigation. Visit waterbottles.com today and check if their product pages still have Open Graph price tags and whether their structured data is intact. If they broke something, your enriched pages should capture the queries they were previously winning.

07 ACTION PLAN · Next Steps Based on Data

TODAY

Submit 5 URLs to Google Search Console (quota reset)

Go to search.google.com/search-console. Submit in this order: myron-enriched → imperial-enriched → index hub → myron-thin → imperial-thin. Enriched pages first. This starts the Google AI Mode indexing clock — expect first signal within 3-5 days.

TODAY

Investigate WaterBottles.com disappearance

Visit waterbottles.com and view source. Check: is `og:price` still present? Is Schema.org Product JSON-LD intact? Run one of the queries they previously won (Q9, Q10 comparison queries). If their structured data broke, your enriched pages have an open lane.

TODAY

Send 5 LinkedIn outreach messages with experiment URL

Your pages are live. Use catalogiq-delta.vercel.app/experiment/drinkware/ as the proof point in outreach. Message: "I built a live experiment showing exactly the gap I keep finding — before vs after enrichment. See for yourself: [URL]. Free audit for [Company]?"

MAY 24

Day 7 Measurement — Run all 20 queries × 3 platforms

Priority queries to watch: Q19 (workflow, 7 days), Q18 (negative, quality), Q3 (laser BPA), Q16 (eco + turnaround), Q4 (40oz min 24 units). Run Perplexity queries 3× each across 2hr window. Check Google AI Mode first — most likely to show first experiment page citation. Record all results in tracker Day 7 session tab.

MAY 24

Write LinkedIn post with Day 7 data

Whatever you find on May 24 — positive or negative — becomes a LinkedIn post. "I ran the same 20 ChatGPT queries again 5 days later. Here is what changed and why." Real data with a real experiment is the most credible content you can publish. Post by May 25.

MAY 27

Day 14 Primary Measurement

Run all 20 queries again. This is the primary experiment measurement. By Day 14, Perplexity should have indexed your enriched pages (Bing submitted May 17). Google AI Mode should show enriched page citations. Compare thin vs enriched citation rates. If enriched pages appear in any response — that is your product validation.

ONGOING

Continue 5 LinkedIn messages every alternate day

The outreach skill is running. Keep the cadence. Each batch personalized with the specific ChatGPT test result for each company before sending. Goal: 5 discovery call conversations before June 1.
